
(a) Early execution and later input confirmation meet at selection
Predicted input $\widehat{P}_2$
Already running full call j_3
Original ASR → Correct/Update
result
[AU] Original result P_3
+ confirmed current parent
+ owned identity
sync → install
Later selected parent P_2
[EL] Complete frozen input
$\widehat{P}_2 = P_2$ at same frontier?
Match: keep call Refuted: reject Unknown: may run/buffer; no commit
Own predicted $\widehat{P}_3$ may differ from original result P_3
(b) The selected parent independently triggers whole-view support
Selected parent P_2
Snapshot replacement
Render P_2; lose ahead h
h is the whole ahead view
[SUP] Whole path $S(P_2, h)$?
Supported: retain whole h
Unsupported: render selected state
Solid: data flow. Dashed: check evidence. Schematic; no measured time scale.
